

Dear All

Greetings of the festive season from the editorial team of IJCCR.

Our first issue (July–August) was well appreciated by the readers. The second issue continues to maintain the same standard of case reporting. Of the case reports which are submitted to IJCCR, a select team of reviewers shortlist the cases and few are rejected on the basis of non-relevance to critical care and lack of novelty. We encourage all the members of the Indian Society of Critical Care Medicine and other readers to contribute actively to our journal. The present issue of the journal will present case reports of infections caused by rare microorganism, a report of rare association of osmotic demyelination syndrome without sodium fluctuation, two hematological case reports of splenic rupture in leukemia and rare presentation of hemophilia. We present two cases pertaining to poisoning and electrical injury. An interesting case report on a novel treatment method for critical illness neuropathy, two cardiac cases of cardiac tamponade and right ventricular infarct. A rare case of hypoxia post-liver transplant is also presented. Presentation of cases from various systems increases the generalizability of case reports and gives them a different flavor from a single organ-specific cases. As promised, our future issues will have sections on clinic microbiological and bedside clinical discussion sections. We hope you keep on enjoying our journal and send to us your comments for further improvement at editor.ijccr@gmail.com.

Best wishes from the Editorial Team of IJCCR!

Subhash Todi
Editor-in-Chief
Indian Journal of Critical Care Case Report (IJCCR)
